

```
public int hashCode()
{
    return i;
}
```

if we are returning $i \% 9$ then o/p will be changed.

O/P $\Rightarrow \{ 16 = F, 15 = D, 6 = C, 23 = E, 5 = A, 2 = B \}$

```
public String toString()
{
    return i + " ";
}
```

Q }

\Rightarrow D.I.C = 11 (for H/M)

O/P $\Rightarrow \{ 6 = C, 16 = F, 5 = A, 15 = D, 2 = B, 23 = E \}$

10	
9	
8	
7	
6	6 = C
5	5 = A, 16 = F
4	15 = D
3	
2	2 = B
1	23 = E
0	

From Top to bottom and From Right to left.

\Rightarrow In the above prog, if we change the HashTable implementation as

```
HashTable h = new HashMap(25);
```

then O/P is $\Rightarrow \{ 23 = E, 16 = F, \dots \}$

24	
23	23 = E
16	16 = F
15	15 = D
6	6 = C
5	5 = A
2	2 = B
0	

=> Properties :-

→ In our prog, if any thing which changes frequently (like username, pass word, mailid, mob no etc) are not recommended to hard code in java prog. because if there is any change to reflect that change re compilation, rebuild, and re deploy application are required. even sometimes server restart also required. which creates a big ^{business} impact to the client.

We can overcome this problem by using properties file. Such type of variable things we have to configure in the properties file. From that properties file, we have to read into java programme and we can use those properties.

The main advantage of this approach is if there is a change in properties file, to reflect that change, just re-deployment is enough which ~~are~~ won't create any business impact to the client.

→ We can use java properties objects to hold properties which are coming from properties file.

→ In normal map (like HashMap, Hash Table, TreeMap) key and value can be any type. but, in the case of properties key and value should be of String type.

Constructor :-

① `properties p = new properties();`

Methods :-

① `String setProperty (String pname, String pvalue)`

↳ to set a new property.

→ If the specified property already available. then old value
