RA → Registration & Administration

→ I am Binay Kumar, currently I am working for GXS India Technology center. Now it's a OpenText. The project which I am working is a TGO-RA. (Trading Grid online - Registration and Administration) *Actually TGO is one complete big application and for that application we are handling RA (Registration and administration) module. Again this RA (Registration & Adminstration) is divided into sub component like administration, subscription, MSAadmin & Registration. Actually GXS provides an interface so that before so that company/customer can do their business with their partners.

Ex:- Suppose you (Interviewer) (A) want to do business with me (B) so what you will do, you will contact GXS and GXS guys will will escape some basic information (like, company name, type of business, company address etc). In their system (B). Now you (A) will tell to GXS that to whom you want to do business. Suppose you want to do business with me.

So, Gxs people will create one invitation on behalf of you (A). And this invitation can be generic (which can be used for multi-time) or private (this type of invitation can be used for only one time).

→ During creation of invitation we will subscribe some bundles and the bundle will have some mandatory and optional features. And the last step is during the creation of invitation, will provide the email id of partner. So once the invitation is created, partner will get the email confirming the Gxs link with invitation code. Once the partner

partner will click the link in his mail. After clicking the link, system will redirect to Gxs Registration page (This is similar to the sign up). For the Registration page

partner has to enter invitation code for registration, and partner can do the registration himself by entering some information like company information, what kind of package subscription, etc.

Now both the company got registered for the GPS system once the companies got registered in the GPS system. Both company can subscribe some additional packages. (This subscription of packages comes under Subscription component.) Administering component deals with the admin features of all the companies and Registration section deals with the registration features of the companies and MSG Admin Component deals with the EDI creation of the companies.

To the Admin Component of this TGO-RA we are handling Company profile, User Management Service Bundle creation and Solution id creation; and user pass policy.

a) Admin :-
a) Company profile:- company profile gives the details about company like company name, address, company creation date, company Billing profile details.

b) User Management : - User Management section deals with

Gold

the, listing all the users created for that company, create the new user for the company and we can select the user and in user details / or user modify page we can update the user details, and in the service privileges page, we can select the service privileges / role for like community manager, Account Manager, Active Invoice Compliance etc.

c) Solution provisioning :- In the Solution provisioning, we can create the solution id and Service Bundles. Solution id is located by selecting owner company, HubService bundle template, spoke service template. And Service Bundle is created by using owner company, service bundle template, and by selecting some addition and mandatory optional packages.

2) Subscription :-

a) Subscription to packages comes under subscription component. After the company is created, it will be subscribe to some services

165

If the TANS (Trading and Messaging Services), IPS (Intelligent Web form service), Active Criteria, order life cycle, Active invitee, Compliance. Again one service can have multiple Service Bundles and each Service bundle will have some optional and mandatory packages. And also After the Service bundle selection, company will be subscribe to Service bundle, and we can also Add another subscription to company once the company is subscribed to subscription package.

- 3) Registration: A new company will be registered in the GxS system by using invitation code which will be send to the company. After the invitation is created. (When After entering the invitation code, invitation code will be validated, if the validation is successfull, system will ask you to enter the company information, after this, you have to select the service, Service Billing, terms & conditions, optional features, user details, (during registration, one user will be selected by default)
